# COUNTY OF SANTA CLARA

## DEPARTMENT OF AGRICULTURE

DAVID T. RAYNER

AGRICULTURAL COMMISSIONER AND  
STATE PLANT QUARANTINE OFFICER

227 NORTH FIRST STREET  
SAN JOSE 13, CALIFORNIA

PHONE CYPRESS 5-1050

April 30, 1958

Mr. W. C. Jacobsen, Director  
State Department of Agriculture  
and  
The Honorable Board of Supervisors  
of Santa Clara County

Gentlemen:

Section 65.5 of the Agricultural Code requires the Agricultural Commissioner to compile a report on the condition, acreage, production and value of the agricultural products of the county. In accordance with this requirement, I am submitting the 1957 Agricultural Crop Report for Santa Clara County.

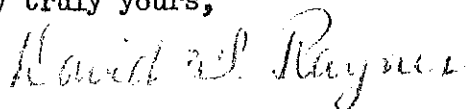

The figures shown in this year's report represent the gross receipts to the grower at the point of production. The values received are for the products only, and do not include container costs.

On this basis, the gross return to the producers for the commodities listed in this 1957 report amounts to \$86,579,979, as compared to \$98,268,345 for 1956. The strikingly large decrease in the total value of our 1957 agricultural production was due mainly to lower prices, and in some instances, lower production due to decrease in acreage and considerable crop damage from adverse weather conditions. It reflects, also, the deletion of the cost of containers which was previously included in the value of many crops.

Increased production and better prices accounted for higher values in some crops. Namely, peaches, plums, walnuts, pole beans, cucumbers and cut flowers.

I wish to express my sincere thanks to the many individuals and organizations who so willingly contributed the information which made the compilation of this report possible.

Very truly yours,

DAVID T. RAYNER  
AGRICULTURAL COMMISSIONER

DTR:kb

ANNUAL CROP REPORT

Of The

County of Santa Clara

For the Year Ending  
December 31, 1957

DAVID T. RAYNER  
Agricultural Commissioner

Compiled by  
Assistant Agricultural Commissioner  
T. J. Moniz

## C R O P S U M M A R Y

APRICOTS: The apricot tonnage was slightly higher on a slightly lower bearing acreage, with total crop value down \$2,330,660 from the previous year. This is due to considerably lower prices. There was a small increase in dried tonnage because of the low fresh fruit prices.

CHERRIES: Cherries realized an increase in bearing acreage, but production was much lower than in 1956. The lower tonnage coupled with a lower shipping return caused considerable reduction in grower returns. Total crop value dropped from \$5,809,900 to \$3,759,200; however, the exclusion of container costs this year accounts for approximately \$216,000 of this difference. Unseasonal heavy late spring rains caused severe damage to ripening fruit and were responsible for the reduced production. The Bing variety, which is the main shipping cherry, was most affected. Overall quality reduction, particularly breakdown of fruit in transit was also caused by the rains, and was a strong contributing factor for reduced shipping unit prices.

PEARS: Pear production was greater, accompanied with a slight increase in bearing acreage. Total crop value shows a decrease of \$645,105 from 1956. This is due, primarily, to considerable reduction of prices paid by processors. Shipping returns were also a little lower than in 1956. There was some crop loss, principally to the Hardy variety, because of processors' reluctance to pack this variety.

PRUNES: The decrease in prune acreage due to displacement by urban development continues to lead all other fruit crops. This is partially responsible for the decreased production this year. Prices show little advance over the previous year and failed to compensate for the lower tonnage

produced. Consequently, the lower total crop value this year. The slightly lower production of small size prunes and the fact that a considerable tonnage of small fruit was unharvested, also contributed to the decrease in crop value.

WALNUTS: Walnuts show a bearing acreage and production decrease. However, higher prices paid by processors brought the total crop value above that of 1956. Blight incidence increased considerably, and some orchards were severely affected, further explaining the lower production.

STRAWBERRIES: A heavy packed carryover caused a low opening price of eight cents per pound to be offered by the processors. Unseasonal late spring rains eliminated a good portion of the early crop to ease the situation somewhat with processing prices advancing slightly. The lower processor's prices paid this year caused a much greater volume of the crop to be shipped to fresh markets serving to lower average returns from this outlet. This year container costs were not included in the unit value of strawberries shipped, and this accounts for an additional decrease in total value amounting to \$1,101,540. This should also be taken into account when noting the variance in total returns from 1956 which were \$13,516,748, compared to \$8,356,980 for 1957.

VEGETABLES: Total vegetable acreage decreased about 4,900 acres from the previous year. The total crop valuation dropped approximately \$1,723,000 from the \$12,252,000 total in 1956. This was due mainly to a combination of slightly lower yields and low prices received for most of the crops. Total valuation of all vegetable crops was \$10,528,162.

LIVESTOCK AND LIVESTOCK PRODUCTS: We believe the estimated figures shown in this report, which were obtained from several sources are about the best available. A slight increase in valuation of \$31,180 over the previous year was due to higher prices received for most of the cattle, even

though there was a decrease in the number of animals sold in 1957, compared to those sold in 1956.

POULTRY AND RABBITS: Even though there was an increase of producing hens, which in turn increased the egg production and a substantial increase in production and sale of all meat birds, the total revenue of \$7,111,748 was \$15,692 lower than in 1956. This was due mainly to much lower prices received by the producer.

FIELD CROPS: There was an increase in field crop acreage of 2,970 acres over 1956, due primarily to the increased planting of sugar beets, grain, and hay. The prices paid the producer were about the same as for 1956. The increased value over 1956 was \$306,530 for all field crops.

CUT FLOWERS: The major increase in valuation of a single crop was in chrysanthemum production. An increase of \$1,891,300 over the 1956 value, was due chiefly to considerably higher production, brought about by double cropping in heated plastic and glasshouses. A sizable increase in producing area brought about by the addition of nine new growers to the industry, and realization of a slightly higher price for the product also contributed to the increased valuation. The total revenue for this crop was \$3,308,800.

Asters, carnations, roses and other cut flowers also showed a good gain in revenue. The combined total increased value of these flowers was \$369,504 over that of 1956. This gain in value was due principally to additional production on a larger area by more growers, and by a very small increase in price.
